APPROVED METHOD: OPTICAL AND ELECTRICAL MEASUREMENTS OF FAR UV-C EXCIMER SOURCES

AN AMERICAN NATIONAL STANDARD

Publication of this Approved Method
has been approved by IES.
Suggestions for revisions
should be directed to IES.

Prepared by
The IES Testing Procedures Committee

Approved by the IES Standards Committee, August 10, 2022, as a Transaction of the Illuminating Engineering Society.

Approved October 24, 2022, as an American National Standard.

Published by the Illuminating Engineering Society, 120 Wall Street, New York, New York 10005.

IES Standards are developed through committee consensus and produced by the IES Office in New York. Careful attention is given to style and accuracy. If any errors are noted in this document, please forward them to the Director of Standards, at standards@ies.org or the above address, for verification and correction. The IES welcomes and urges feedback and comments.

Printed in the United States of America.

DISCLAIMER

IES publications are developed through the consensus standards development process approved by the American National Standards Institute. This process brings together volunteers representing varied viewpoints and interests to achieve consensus on lighting recommendations. While the IES administers the process and establishes policies and procedures to promote fairness in the development of consensus, it makes no guaranty or warranty as to the accuracy or completeness of any information published herein.

The IES disclaims liability for any injury to persons or property or other damages of any nature whatsoever, whether special, indirect, consequential or compensatory, directly or indirectly resulting from the publication, use of, or reliance on this document.

In issuing and making this document available, the IES is not undertaking to render professional or other services for or on behalf of any person or entity. Nor is the IES undertaking to perform any duty owed by any person or entity to someone else. Anyone using this document should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

The IES has no power, nor does it undertake, to police or enforce compliance with the contents of this document. Nor does the IES list, certify, test or inspect products, designs, or installations for compliance with this document. Any certification or statement of compliance with the requirements of this document shall not be attributable to the IES and is solely the responsibility of the certifier or maker of the statement.

AMERICAN NATIONAL STANDARD

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether that person has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation to any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of approval. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

CONTENTS

1.0 Introduction and Scope

1.1 Introduction

The ultraviolet-C (UV-C) spectrum is typically defined as being from 100 nm to 280 nm. This spectrum can be further divided into other defined UV-C ranges, such as vacuum-UV (100 nm to 200 nm) and far UV-C (200 nm to 230 nm). While "far UV-C" is not officially defined, this is the meaning of the term as used in this document.

The use of far UV-C optical radiation sources in various disinfection applications is a subject of increasing interest. The main reason is that this region of the UV spectrum (200 nm to 230 nm) offers a high rate of pathogen reduction, with much lower photobiological risk than that of longer-wavelength UV devices, and without the problems associated with ozone generation at shorter UV wavelengths.

Far UV-C optical radiation is commonly produced by excimer sources (krypton bromide, KrBr*, and krypton chloride, KrCl*). (The asterisk in the symbol indicates that the molecule is an excimer; see **Section 3.4 excimer lamp**). However, other radiation sources, such as LEDs, are expected to become available in the future.

Excimer lamps work on the principle of a dielectric barrier discharge. A short pulse of electrical high-energy discharge is formed in a quartz vessel that is filled with a rare gas (e.g., krypton or xenon) and typically with an additional small amount of a halogen (chlorine, bromine, or iodine). Within the high-energy discharge, excimers are formed that will emit specific wavelengths during decay. It is important to note that although the main energy is emitted at the typical wavelength of the filling mixture (e.g., 222 nm with KrCl* and 207 nm with KrBr*), there is radiation at wavelengths outside of the far UV-C range (i.e., shorter than 200 nm and longer than 230 nm).

The discharge vessel does not contain inner electrodes, and energy is supplied through a capacitive discharge by applying electrodes to the outside of the vessel. The drivers of such excimer lamps are always specific to a particular type of lamp. Typically, the drivers supply very high voltage pulses (2 to 30 µs long), on the order of 2 to 10 kV, depending on lamp power and design.

1.2 Scope

This Approved Method considers the specific measurement challenges and characteristics of far UV-C optical radiation sources and does not focus on the measurement of energy efficacy but on application-relevant data such as electrical, irradiance, spectral distribution, and angular distribution of the optical radiation source, including the driver. The main reason for this different approach (compared to that used for other UV-C optical radiation sources, like UV-C LEDs and low-pressure mercury lamps) is that other reliable measurement methods (e.g., in a sphere) to measure total output power in the far UV-C range are not yet established.

This document describes the procedures to be followed and the precautions to be observed in performing uniform and reproducible measurements of the electrical and ultraviolet optical radiation characteristics of far UV-C excimer sources predominantly emitting at a peak wavelength within the far UV-C range (200 nm to 230 nm). The wavelength range for the purposes of this document is 200 nm to 300 nm.

This Approved Method does not address changes in optical radiation properties over time.

This approved method does not address the measurement for the production of ozone.

This standard does not address the safety concerns associated with making these measurements. It is the responsibility of the user of this standard to establish appropriate safety and health practices. Additional information on safety with respect to UV radiation may be found in *ANSI/IES RP-27.1-22, Recommended Practice: Risk Group Classification and Minimization of Photobiological Hazards From Ultraviolet Lamps and Lamp Systems*.[1]
